### **MODALITETI AGRESIVNOSTI DELINKVENATA NARKOMANA**

Centralna tema našeg istraživanja su modaliteti agresivnosti, karakteristični za delinkventnu populaciju uopšte, a posebno za grupu delinkvenata narkomana. Česti pratilac zavisničkog ponašanja je i sklonost ka kriminalnom ponašanju, čije je modalitete potrebno shvatiti i istražiti i u svetlu savremenih socijalno-devijantnih oblika funkcionisanja. Naše istraživanje je obuhvatilo 160 ispitanika, razvrstanih u 4 grupe: grupu narkomana delinkvenata, delinkvenata koji kaznu zatvora služe u zatvorenom delu KPZ, delinkvenata koji kaznu zatvora služe u otvorenom delu KPZ i kontrolnu grupu normalnih ispitanika. Ove grupe upoređivane su među sobom u pogledu intenziteta i modaliteta agresivnosti. Dobijeni podaci bi mogli pružiti korisna usmerenja u sprovođenju vaspitnih i penalnih mera. Rezultati istraživanja sprovedenog testovima agresivnosti SIGMA prof. Momirovića i saradnika, potvrdili su većinu postavljenih pretpostavki. Grupa delinkvenata narkomana pokazala je više vrednosti primarne i oralne agresivnosti u odnosu na grupu delinkvenata nenarkomana. Značajne razlike postoje i između dve grupe delinkvenata nenarkomana što ukazuje na značaj organizacije modela sprovođenja kazne.

**Ključne reči:** agresivnost, delinkventi, delinkventi narkomani

### **DELINQUENT DRUG ADDICTS' AGGRESSIVITY MODALITIES**

The main topics of our investigation are the modalities of aggressivity, which characterise delinquent population in general, and especially the group of delinquent drug addicts. Addictive behaviour is frequently followed by a tendency towards criminal behaviour, which modalities is necessary to be explored and investigated in the lights of contemporary forms of socially-deviant functioning. Our investigation has been conducted on 160 subjects, divided into 4 groups: delinquent drug addicts, delinquent which spend their time in jail in the isolated part, delinquents which spend their time in semi-open part of the jail, and the

control group of normal subjects. We have compared these groups concerning the intensity and the modality of aggressivity. The data we have gained could give useful direction for future educational and penal procedure. The investigation results, conducted by the Prof. Momirovic's aggressivity inventories, have confirmed the majority of primary hypothesis. The group of delinquent drug addicts has shown higher levels of primal and oral aggressivity in the comparison with the group of delinquent non-drug addicts. There are significant differences between the two delinquent non-drug addicts, which underline the importance of the specific penalty organisation model.
