ZAŠTO NEMAM PARTNERA? DIMENZIJE LIČNOSTI, OBRASCI AFEKTIVNE VEZANOSTI, STILOVI LJUBAVI I PARTNERSKI STATUS

Uprkos ogromnoj važnosti partnerskih relacija za pojedinca, mnoge osobe u mladom odrasлом dobu smatraju da je teško uspostaviti i održati kvalitetne partnerske odnose. Predmet istraživanja je ispitivanje razlika i mogućnosti diskriminacije pojedinaca različitog partnerskog statusa, tj. osoba koje imaju partnera i pojedinaca koji su sami, a na temelju osobina ličnosti, obrazaca afektivne vezanosti i stilova ljubavi. Uzorak je sačinjen od 500 ispitanika (starosti od 18-40 godina), od kojih je 355 u vezi ili braku. Obrasci afektivne vezanosti, i dimenzije koje im stoje u osnovi, operacionalizovane su RQ upitnikom, stilovi ljubavi Skalom ljubavnih stavova, osobine ličnosti inventarom BFI, dok je samopoštovanje mereno Rozenbergovom skalom globalnog samopoštovanja. Rezultati diskriminativne analize sugerišu da postoje razlike između pojedinaca koji su sami i onih koji imaju partnera. Konkretno, oni ne razlikuju u pogledu strukturi ličnosti, ali se mogu dobro diskriminisati na temelju određenih stavova prema sebi i drugima, tj. dimenzijama Anksioznost i Izbegavanje i prema usvojenim stilovima ljubavi: Eros, Agape, Ludus i Storge.

Ključne reči: partnerski status, stilovi ljubavi, obrasci afektivne vezanosti, dimenzije ličnosti

WHY AM I SINGLE? PERSONALITY DIMENSIONS, ATTACHEMNT PATTERNS, LOVE STYLES AND RELATIONSHIP STATUS

Despite the significance of having romantic partner, many young adults find it difficult to establish well-functioning intimate relationships. The subject of the study is to examine the differences and possibility to discriminate individuals differentn their relationship status, depending on whether they are single or in romantic relationship, based on personality dimensions, patterns of attachment and love styles. The sample is consisted o of 500 subjects (aged 18-40), of which 355 respondents were in relationship. The patterns of attachment were operationalized by RQ questionnaire, love styles by Love Attitudes Scale, personality dimensions by BFI inventory and self-esteem was

measured The Rosenberg Self-Esteem Scale. The results of discriminant analysis suggest that there are differences between individuals who are single and those who have a partner. They do not vary according to the structure of personality, but they can be well discriminated on the basis of certain attitudes toward themselves and others, ie. Anxiety and Avoidance dimensions and, consequently, adopted styles of love: Eros, Agape, Ludus and Storge.

Keywords: relationship status, love styles, attachment patterns, personality dimensions
